

PRODUCT SUMMARY

The Holzworth HSM Series RF Synthesizer Modules are stand alone, CW sources. These sources are designed as building blocks for systems integration where performance at the foundation is critical. Holzworth synthesizers provide best in industry stability. When integrated as multiple units, the result is true phase coherency with industry leading channel-to-channel stability. Compare the HSM Series to competitive designs and discover the most compact form factor available in its overall performance class.

The core architecture of the HSM Series modules is derived from Holzworth’s proprietary NON-PLL design to provide the ultimate in phase / frequency stability. This direct-digital/direct-analog hybrid design was originally developed as a key building block for our phase noise analysis products. The hybrid architecture provides frequency agility & resolution, phase continuous switching and predictable performance without compromising on spurious or phase noise performance.

HSM EXTENDED FREQUENCY OPTIONS:

Model No.	Frequency Range	Phase Noise Performance
HSM1001A	250kHz to 1GHz	-133dBc/Hz at 1GHz (10kHz offset)
HSM2001A	250kHz to 2GHz	-127dBc/Hz at 2GHz (10kHz offset)
HSM3001A	250kHz to 3GHz	-123dBc/Hz at 3GHz (10kHz offset)
HSM4001A	250kHz to 4GHz	-121dBc/Hz at 4GHz (10kHz offset)
HSM6001A	250kHz to 6.4GHz	-117dBc/Hz at 6GHz (10kHz offset)

Note: Holzworth’s “Ultra Low Phase Noise” statement is real. We make no assumptions. 100% of all RF synthesizers manufactured by Holzworth Instrumentation are subjected to full phase noise evaluation. This critical parameter cannot be accepted as being “OK” based on spectrum analysis or an alternate test.

The versatile HSM Synthesizer Modules can be controlled directly via the SPI bus, the Holzworth GUI, a preloaded lookup table, LabVIEW™, MATLAB™, C++, C#, etc. Some systems integrators have preferred the supported Linux platform over a Windows based PC. An advanced application example uses a preloaded lookup table in a multi-channel configuration further leveraging the unique NON-PLL characteristics to achieve switching speeds of <100ns with phase memory.

The attractive performance-to-price ratios available with the Holzworth HSM Series offer optimal solutions for electronics design, manufacturing test applications, and OEM systems integration.

Finally, with MTBFs greater than 200,000 hours, the HSM Series synthesizer modules have been designed to exceed the most stringent reliability requirements.

- #### HSM DESIGN HIGHLIGHTS
- **Amplitude Accuracy ±0.25dB to as low as -70dBm**
 - **Frequency Switching Speed: 6µS, 100% settled**
 - **Pulse Modulation Burst Mode (internal pulse)**
 - **Onboard Precision 100MHz OCXO**
 - **100MHz Reference Out: -165dBc/Hz^{1/2} (10kHz OS)**
 - **Reference Input: 10MHz or 100MHz**
 - **SPI or USB Communications Interface**
 - **Internal Temperature Monitor Output**

ELECTRICAL SPECIFICATIONS - FREQUENCY

The specified parameters for the HSM Series RF Synthesizer Modules are fully verified at final performance test and 100% guaranteed for the warranted life of the product. Performance specifications listed on this page are specific to Frequency.

¹ Specifications are subject to change per the discretion of Holzworth Instrumentation, Inc.

² All MIN/ MAX (Minimum/ Maximum) performance parameters are guaranteed and 100% verified during final performance test.

³ Typical performance is "by design" and consistent with field performance data.

ELECTRICAL SPECIFICATIONS - MODULATION (External Stimulus)

The modulation parameters listed here are based on modulation functions as related to the use of an external modulation stimulus. Internal “self pulse” functions are available with the current revision of the HSM series RF synthesizers (to be specified).

PARAMETER	PERFORMANCE	COMMENTS
FREQUENCY MODULATION¹ (Analog)		
Max Deviation	100 kHz	
Resolution	0.01% or 1mHz, whichever is greater	
Modulation Freq. Response	DC to 20 kHz (-3dB)	DC Coupled
Sensitivity when using Ext. Input	± 1V peak into 50Ω	+ 1V: Maximum Positive Deviation 0V: Zero Deviation from Carrier - 1V: Maximum Negative Deviation
PHASE MODULATION¹ (Analog)		
Modulation Deviation	±1.6 deg to ±180 deg	
Frequency Response	DC to 20 kHz (-3dB)	DC Coupled
Resolution	Frequency Dependent	See Phase Offset Specification
Sensitivity when using Ext. Input	± 1V peak into 50Ω	+ 1V: Maximum Positive Deviation 0V: Zero Deviation from Carrier - 1V: Maximum Negative Deviation
AMPLITUDE MODULATION¹ (Analog)		
AM Depth Type	Linear	
Depth	5% to 75%	0.45 dB to 12 dB
Maximum Resolution	<3% of Maximum Depth	
Depth Accuracy	5% of Maximum Depth	
Modulation Rate	DC to 10 kHz (-3dB)	DC Coupled
Sensitivity when using Ext. Input	± 1V peak for indicated Depth (into 50Ω)	+ 1V: Maximum Amplitude 0V: 50% of Maximum Depth - 1V: Maximum Depth
PULSE MODULATION¹ (Analog)		
Risetime (T _r)	<100 ns	
Falltime (T _f)	<100 ns	
On/Off Ratio	> 70dB	
Minimum Pulse Width	200 ns	
ALC Loop Deviation (ALC disabled)	1dB difference from ALC enabled	

¹ Specifications are subject to change per the discretion of Holzworth Instrumentation, Inc

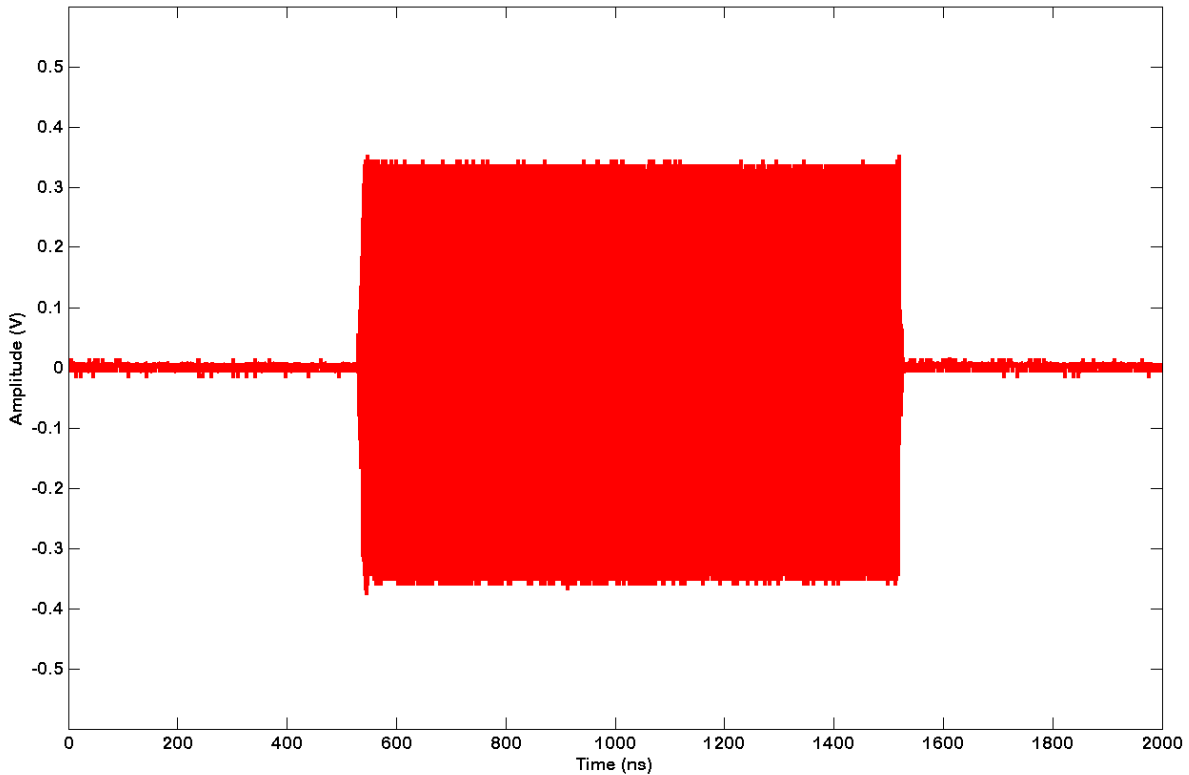

PARAMETER	PERFORMANCE	COMMENTS
External Trigger Threshold	+1.2V	±5% into 50Ω

ELECTRICAL SPECIFICATIONS - SELF PULSE MODULATION

HSM series synthesizers that have the firmware version 3.31 or higher, are capable of operating in self pulse modulation mode, which does not require an external stimulus signal.

PARAMETER	PERFORMANCE	COMMENTS
PULSE MODULATION¹ (Analog)		
Risetime (T_r) $f_c < 512\text{MHz}$ $f_c > 512\text{MHz}$	11ns (typical) NOT SPECIFIED	
Falltime (T_f)	<100 ns	
On/Off Ratio	> 70dB	
Minimum Pulse Width	1 μs	
ALC Loop Deviation (ALC disabled)	1dB difference from ALC enabled	

¹ Specifications are subject to change per the discretion of Holzworth Instrumentation, Inc

(Figure 1: Self Pulse Mod $f_c = 500\text{MHz}$, 1 μs Pulse²)

² Internal pulse modulation for frequencies greater than 512MHz will exhibit increased settling time. Contact Holzworth customer support for additional data.

ELECTRICAL SPECIFICATIONS - SELF PULSE MODULATION (continued)

Pulse modulation will exhibit longer rise/fall times for frequencies greater than 512 MHz. Figures 2 and 3 below demonstrate this difference between set frequencies.

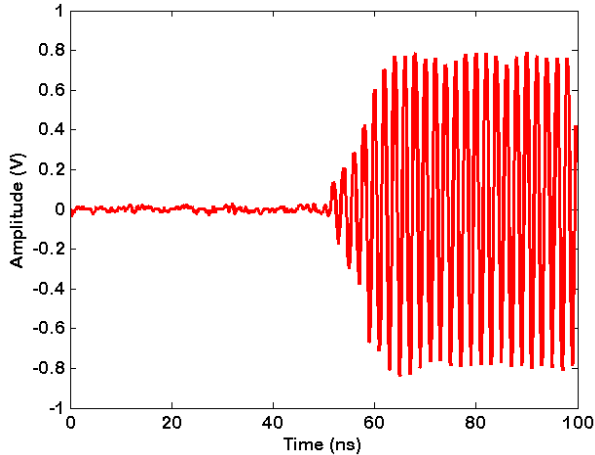

Figure 2a: Pulse Mod Rise Time, $f_c = 500\text{MHz}$

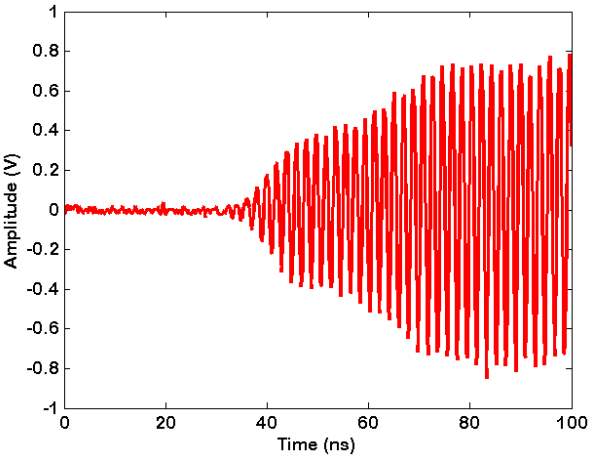

Figure 2b: Pulse Mod Rise Time, $f_c = 530\text{MHz}$

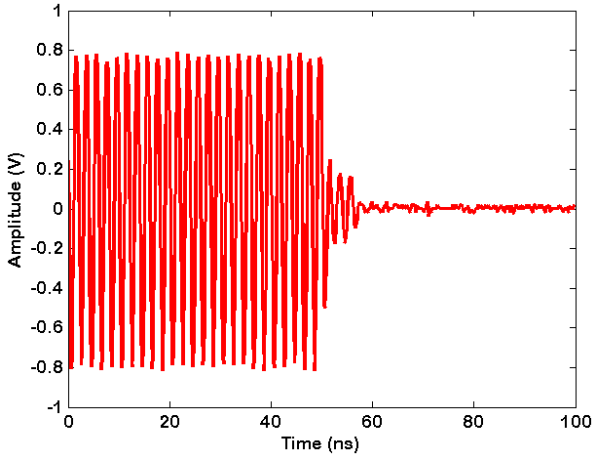

Figure 3a: Pulse Mod Fall Time, $f_c = 500\text{MHz}$

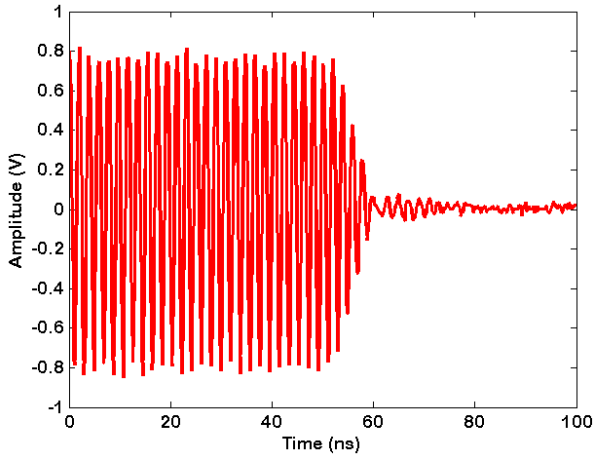

Figure 3b: Pulse Mod Fall Time, $f_c = 530\text{MHz}$

ENVIRONMENTAL SPECIFICATIONS ¹

Environmental specifications are based on component margins, thermal verification testing and current draw tests.

PHASE NOISE DATA - Standard OCXO

The raw data displayed in Figure 1 is of SSB Phase Noise vs. Frequency Offset as measured for the HSM Series RF Synthesizer Modules. All data was collected at an output power setting of +10dBm.

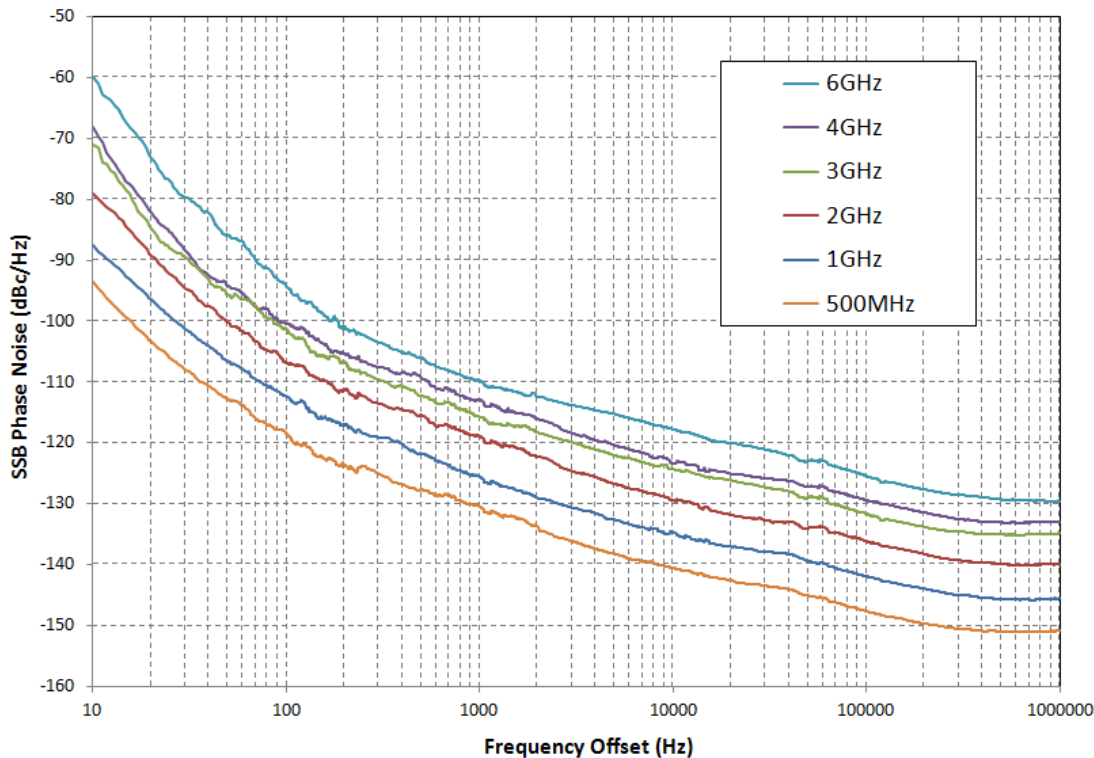

Figure 4: SSB Phase Noise ($P_{OUT}=+10dBm$)

PHASE NOISE DATA - *Optional OCXO*

The HSM Series RF Synthesizer Modules can be equipped with an optional, high performance OCXO. Option OPT-OCXO provides an approximate 10dB improvement in the phase noise at close to the carrier (10Hz offset). The example plots contained in this section show the phase noise improvement with OPT-OCXO versus that with a standard OCXO installed.

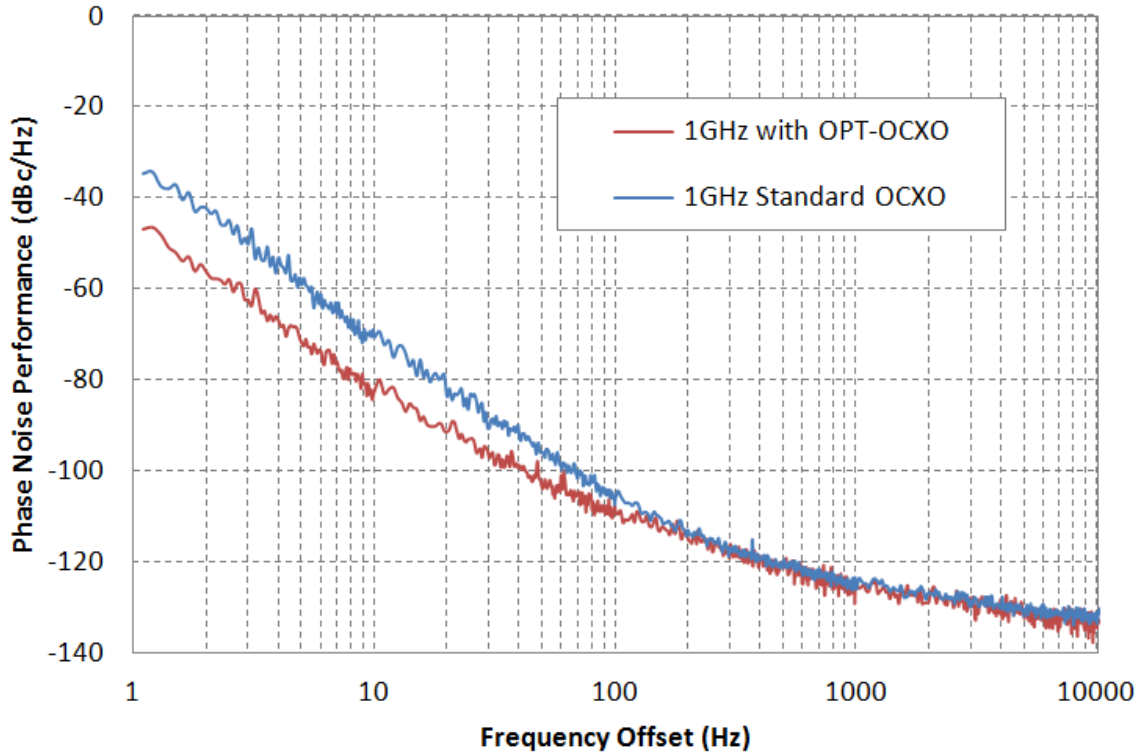

Figure 5: SSB Phase Noise OPT-OCXO Comparison ($P_{OUT}=+10dBm$)

SPECTRAL PURITY DATA

The data contained in this section demonstrates the spectral purity performance of the HSM Series designs. Spectrum analyzer test settings: 300kHz Resolution BW, 30kHz Video BW.

MECHANICAL CONFIGURATION (Standard and OPT-SYS3)

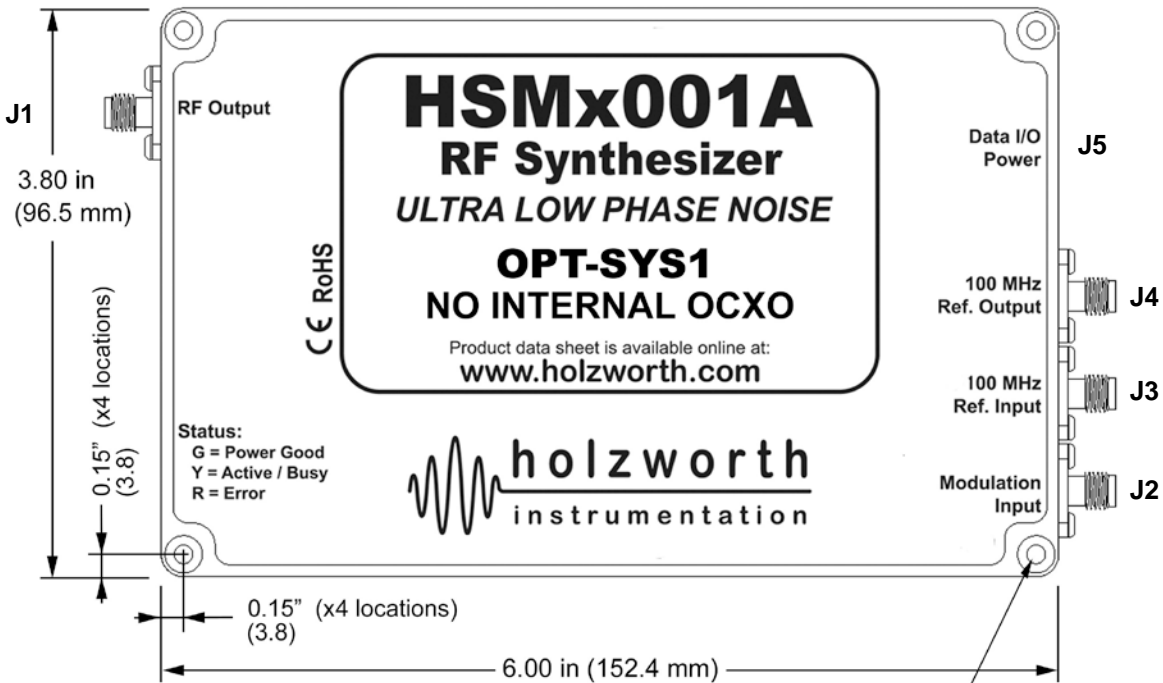

Mechanical details are in both inches and millimeters (listed inside parenthesis). All dimensions hold tolerances to within ± 0.010 inches.

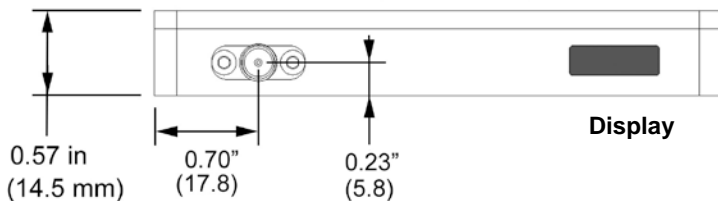

MECHANICAL CONFIGURATION - OPTIONS: OPT-SYS1 / OPT-SYS2

Option "OPT-SYS1" & "OPT-SYS2" do not contain an OCXO, allowing for an extended operating temperature range and smaller form factor. An external 100MHz reference is required. OPT-SYS1 units are performance tested over full specified temperature range. Mechanical details are in both inches and millimeters (listed inside parenthesis). All dimensional tolerances are within ± 0.010 in.

19	GND	20	GND

J5 PIN LABEL DEFINITIONS

PIN Label	DEFINITION
+5V	Nominally pulls 1A from the +5V Rail. Initially at power on the draw will be 100mA then increase as subsystems power-on. Tolerance +10% to -2%. 4.9V to 5.5V.
+12V [or +15V]	Nominally 400mA draw at steady state. 600mA draw at startup for at least 5 mins for OCXO power on. +15V O.K.. but increases power dissipation. Units without OCXO will draw constant 175mA (OPPT-SYS1 & OPT-SYS2).
NC	No Connect. Voltage supply pin. Not currently used.
/RESET	Active low on this pin put the module in reset, releasing it returns to reset operation. Module is ready 1-2 seconds after /RESET is released. 10K pullup to 3.3V in parallel to 0.01uF cap to ground.
/CS	Communications chip select, active low. 47K pullup on this line. /CS must be low for any communication to occur. Allows for multiple synthesizer modules on 1 spi bus. 3.3V logic levels, 5V tolerant.
SDO	Synthesizer (module/slave) Data Output. Connects to Master Serial Data Input (Active when chip select is low. High-Z when /CS is high. 47K pulldown. 3.3V logic levels, 5V tolerant.
SDI	Synthesizer (module/slave) Data Input. Connects to Master Serial Data Output (High-Z input on module. 3.3V logic levels, 5V tolerant. 47K pulldown.
SCLK	SPI Clock (slave clock input). Idle Low, Active High. Data is transitioned into the module on a rising low to high transition. Data is transitioned out on the same edge and is valid on the falling edge of SCLK. 3.3V logic levels, 5V tolerant. 47K pulldown.
Power Good	Open collector output, 47k pullup to 3.3V. When high, power is healthy. When low, either voltages or currents are problematic. Module may not operate correctly. There is a 0.5 second delay from when power is applied to a valid PowerGood. Actual PowerGood may take up to 2 seconds to go high due to some very stable internal references that are settling. This may be multiplexed with other HSM6001 synthesizers.
/ERROR	Open collector output, 47k pullup to 3.3V. Nominally high. If an error condition occurs, such as a PLL unlock or un-leveled condition, this will go active low. This can be multiplexed with other HSM6001 synthesizers.
READY or /BUSY	Open collector output, 47k pullup to 3.3V. Nominally high. After an SPI communication, if a command has been issued, then the /BUSY will go active low until that command is finished. During this time no communication may occur and SPI bus will be asleep.
N.C.	These are reserved lines for use in our communications module. They should be left floating.

J5 (SPI) MATING CONNECTOR PART NUMBERS

APPLICATION	MOLEX PART NUMBER	DESCRIPTION
IDC Ribbon	Molex 87568-2093	2mm Milli-Grid, 20pin (2x10) Female, Polarization and Ramp Locking
Vertical PCB Thru Hole	Molex 79107-7009	2mm Milli-Grid, 20pin (2x10) Female, NO Polarization or Ramp Locking
Vertical PCB SMT	Molex 79109-1009	2mm Milli-Grid, 20pin (2x10) Female, NO Polarization or Ramp Locking

SPI COMMUNICATIONS
BUS OVERVIEW

The SPI bus is a byte oriented bus, sending 8bits at a time. Any number of bytes may be sent, from 1 byte to 64 bytes while chip select is low. Bytes sent beyond 64 bytes will be ignored. The data is held in a buffer until chip select goes high, initiating the parsing of the data and execution of the commands. The maximum speed of the bus is 10Mbits/s. Data may be written to the module and data may be received from the module. After a command is sent requesting data, the next transfer sends this data out on SDO. During the read, a new command may be send and will be parsed when chip select goes high. A read is always followed by a write with a read request.

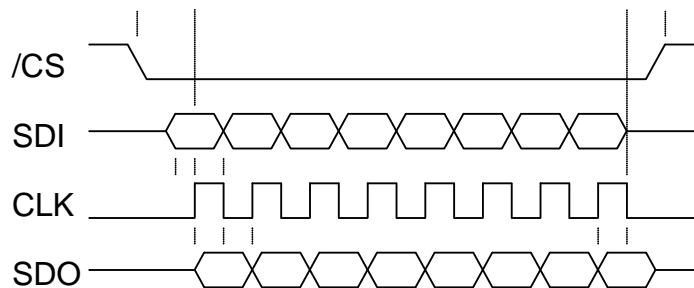

BUS HARDWARE PROTOCOL

Data is clocked into the module on the rising edge of sclk. Data is clocked out of the module on this same edge. Data output is valid on the falling edge of sclk. Data is only transferred when chip select is low. When chip select goes high, this initiates the parsing and execution of data.

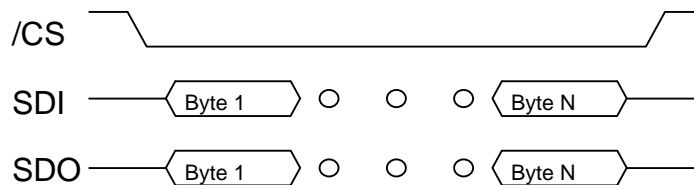

CONTROLLING MULTIPLE SYNTHESIZERS

The SPI bus may be daisy chained. The Status flags can be daisy chained as well, they are open-collector. Each synthesizer requires it's own chip select in a multiple channel scenario.

SPI TIMING

The figure above demonstrates bit level timing where data is sampled into and out of the module on the rising edge of SCLK (Slave Clock). Data out is valid on the falling edge of SCLK.

The above figure displays how byte level communications occurs. Any number of bytes may be sent. After /CS goes high, the data is parsed and executed. If no data is sent, the SPI communications module simply resets itself and no parsing or execution of data occurs. If /CS goes high in the middle of a byte transfer (1-7 bits are sent instead of 8) this byte is ignored.

WARRANTY

All Holzworth synthesizers come with a standard 2 year 100% product warranty covering manufacturing defects. All product repairs and maintenance must be performed by Holzworth Instrumentation. Holzworth reserves the right to invalidate the warranty for any products that have been tampered with or used improperly. Refer to Holzworth Terms & Conditions of Sales for more details.

OPTIONS

Holzworth HSM series RF synthesizers have options to assist with better meeting specific systems requirements.

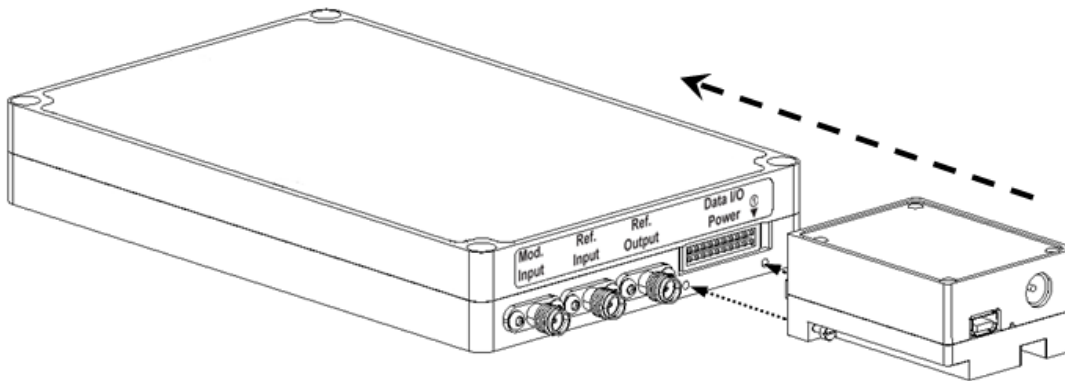

- | | |
|-----------------|--|
| OPT-OCXO | 10dB Improved Close to the Carrier Phase Noise |
| OPT-SYS1 | 14mm Profile (no OCXO), Tested over extended Temp. Range |
| OPT-SYS2 | 14mm Profile (no OCXO), Tested over standard Temp. Range |
| OPT-SYS3 | Includes internal OCXO. Tested over extended Temp. Range with external 100MHz reference. |

Communications modules are also made available for ease of integration or simply to match legacy laboratory communications requirements. USB, Ethernet, *etc.* modules can be purchased directly from Holzworth.

- | | |
|-------------|--|
| HCM1 | USB Communications Module with power supply |
| HCM3 | Ethernet Communications Module with power supply |

HCM Communications Module Installation

The HCM Communication Module is an SPI to USB (or Ethernet) adapter that also includes a power supply adapter allowing the user to connect the RF synthesizer to standard AC power. The selected HCM Module creates a USB (or Ethernet) connection to a PC so that the Holzworth GUI, LabVIEW™, MATLAB™, *etc.* can be utilized to control the source. No drivers are required to run the Holzworth GUI.

Each variation of the HCM Communications Module securely fastens to the synthesizer and comes complete with an AC power supply and the appropriate cable. HCM modules are a recommended accessory as the first step in integrating the HSM series synthesizers via the SPI bus. More information is available upon request.
